

Design Document

Project Description

The goal of this project was to design and implement a personal homepage using vanilla HTML5, CSS3, and ES6. In addition to these components, we were able to use Bootstrap 5. For the site, we were required to have at least two pages that were created without the assistance of AI and one that we used AI to produce. Additionally, we needed to add a creative addition that differentiated it from others.

My personal homepage serves as a personal and professional introduction to me. The personal side is covered in the about and travel sections while my professional experience is displayed by my resume. It also contains links to my GitHub, Bluesky, and email address so that people interested in my experience can delve deeper.

My site contains four pages, three of which were written entirely by hand and the fourth which used AI. The three handmade pages are the landing page (index.html), the about page (about.html), and the travel page (travel.html). The page that was created with AI contains my resume (resume.html).

I included a few different creative additions that make my page standout when compared to others. My about page tells my personal story through six pictures that are related to places I have lived and worked. My travel page contains a carousel of pictures that I have taken in my travels. Finally, a creative element that I created using ES6 is a twist on a countdown clock. A user can select an upcoming trip that I have planned to see how long it will be until I go on that trip. The countdown clock will continue counting down the seconds, minutes, hours, and days until the user selects another trip from the list.

User Personas

1. **Angela, Tech Headhunter.** A recruiter who is interested in my computer science and technical skills, but also wants to know that candidates are well-rounded. She will want to explore more than just the personal homepage. Sites like GitHub will be important to really understand my experience. Angela may also want to be able to contact me.
2. **Carl, Open Source Developer.** A librarian and open source application developer who is interested in speaking with other people who have been working in the field for a while and have knowledge of emerging trends. Carl will want to know what my experience is with open source technologies, and may want to look further at some of the work I have done in the past. He will want to be able to reach out to me.
3. **Tammy, Potential Northeastern Computer Science Graduate Student.** A recent college graduate who is considering applying for Northeastern's masters in computer science at Khoury. Tammy wants to see what experience someone has who is in the

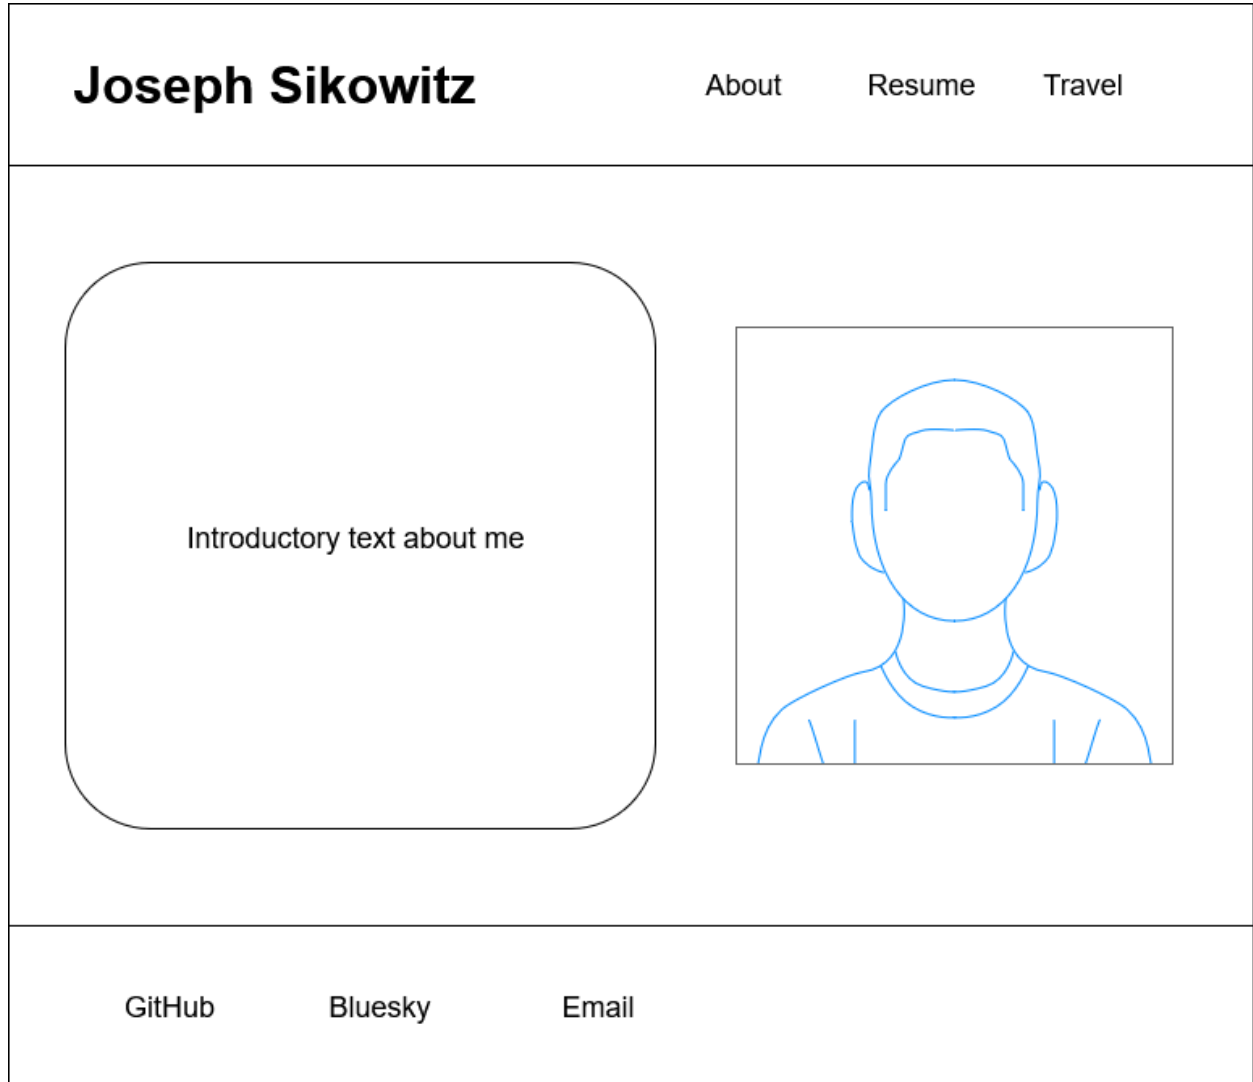

program and may want to peruse my GitHub to see what I have worked on recently as part of the program.

User Stories

1. Angela is emailed a link to my personal homepage by a colleague who thinks that I may be a good fit for a position developing library software at a small company. She immediately sees on the landing page that she can view my public GitHub repositories, but takes a look at my resume page first. She is able to jump down to my technology experience right away and see the languages that I am proficient in. She quickly takes a look at my travel page and sees that I like to travel to different places and that I'm an active person. She clicks the email link in the footer to see if I may be interested in speaking with her about the position.
2. Carl supports an open source library application for his academic library in central Massachusetts, but has been having trouble with bot scraping. He is looking for someone in the field who has managed open source software who may be able to help provide advice. He comes across my homepage, goes to the resume page, and finds that I have a lot of experience hosting and supporting open source software for libraries. He clicks the email link in the footer to see if I would be willing to speak with him about strategies for bot mitigation.
3. Tammy has been considering applying to Northeastern's computer science graduate program for a few years, but she isn't sure what types of projects students complete as part of her coursework. She is interested in making sure that when she graduates she has a strong portfolio to show potential employers. Tammy comes across my page and sees that I did several things before I decided to pursue a masters in computer science. She is inspired and clicks on the GitHub link in the footer to see what I have produced during the program that looks interesting.
